Principles of Distributed Computing Exercise 2: Sample Solution

1 Leader Election in an "almost anonymous" Ring

a) Yes, it is possible:

Algorithm 1 Leader Election (all but one nodes have the same ID)

1: send IDs two hops around the ring

2: if the same ID has been received twice AND the received ID differs from the own ID then

- 3: I am the leader
- $4: \ \mathbf{end} \ \mathbf{if}$

2 Distributed Computation of the AND

- a) Because the size of the ring is not known to the nodes, the case where all nodes have a one as input and the case where all but one nodes have a one as input cannot be distinguished.
- b) All input values have to be sent all around the ring. In order to detect the returning of the own message, we add a hop counter to each message. If the message has made n hops, it has arrived where it started.
- c) The following algorithm calculates the AND in a synchronous, non-uniform ring:

```
Algorithm 2 AND in the Ring: asynchronous, non-uniform (n \text{ is the number of nodes})
```

```
1: if input bit = 0 then
 2:
      send 0 to the neighbor in the ring
 3: end if;
 4: for i := 2 to n do
      if received a 0 and have not already sent a 0 then
 5:
        send 0 to the neighbor in the ring
 6:
      end if
 7:
 8: end for;
9: if received at least one 0 then
      result := 0
10:
11: else
12:
      \operatorname{result} := 1
13: end if;
```

If the result is 1, no message is sent, otherwise there is exactly one message over each link. Thus, time and message complexity are both n.
