

Semester/Master Thesis

Frequency-Hopping Schemes for Sensor Networks

Sensor nodes are equipped with a radio module to communicate with neighboring nodes over the air. Wireless sensor networks operate in a limited frequency spectrum which has to be shared with other applications (e.g., WLAN, Bluetooth). Interferences caused by other radio signals may result in packet loss. Frequency-hopping schemes try to mitigate the impact of interferences from other signals by permanently switching the communication frequency which leads to a better utilization of the available bandwidth and makes the system more robust against jamming.

In this thesis, we are interested in implementing a frequency-hopping scheme for sensor nodes. You should come up with an idea how to switch the communication frequencies between two or more sensor nodes in a coordinated manner. The proposed solution should then be implemented and evaluated on real sensor node hardware (Tinynode platform).

Required Skills

You should already have some skills in software development and you should be familiar with the C and JAVA programming language.

Are you interested? Please contact us by email or phone.
