SA: Mobile Social Networking

Social applications, such as MySpace, LiveJournal, Orkut, Last.fm or Flickr have become extremely popular on the Internet. The rapid development of mobile devices opens an entirely new platform for this kind of applications. We believe that the mobile platform features many interesting properties that new systems can take advantage of.

The goal of this thesis is to implement a social networking system for mobile phones. We have some ideas for such applications in mind that you can extend and implement. However, you are also welcome to propose your own system.

If you are a creative person who likes to produce a system that can potentially be used by hundreds of thousands of users, don’t hesitate to contact us.

Prerequisites:
- Programming skills (Java)
- Some background in cryptography might be of advantage.
