

# Collaborative Filtering

Presentation by Alex Hugger

# Filtering Documents

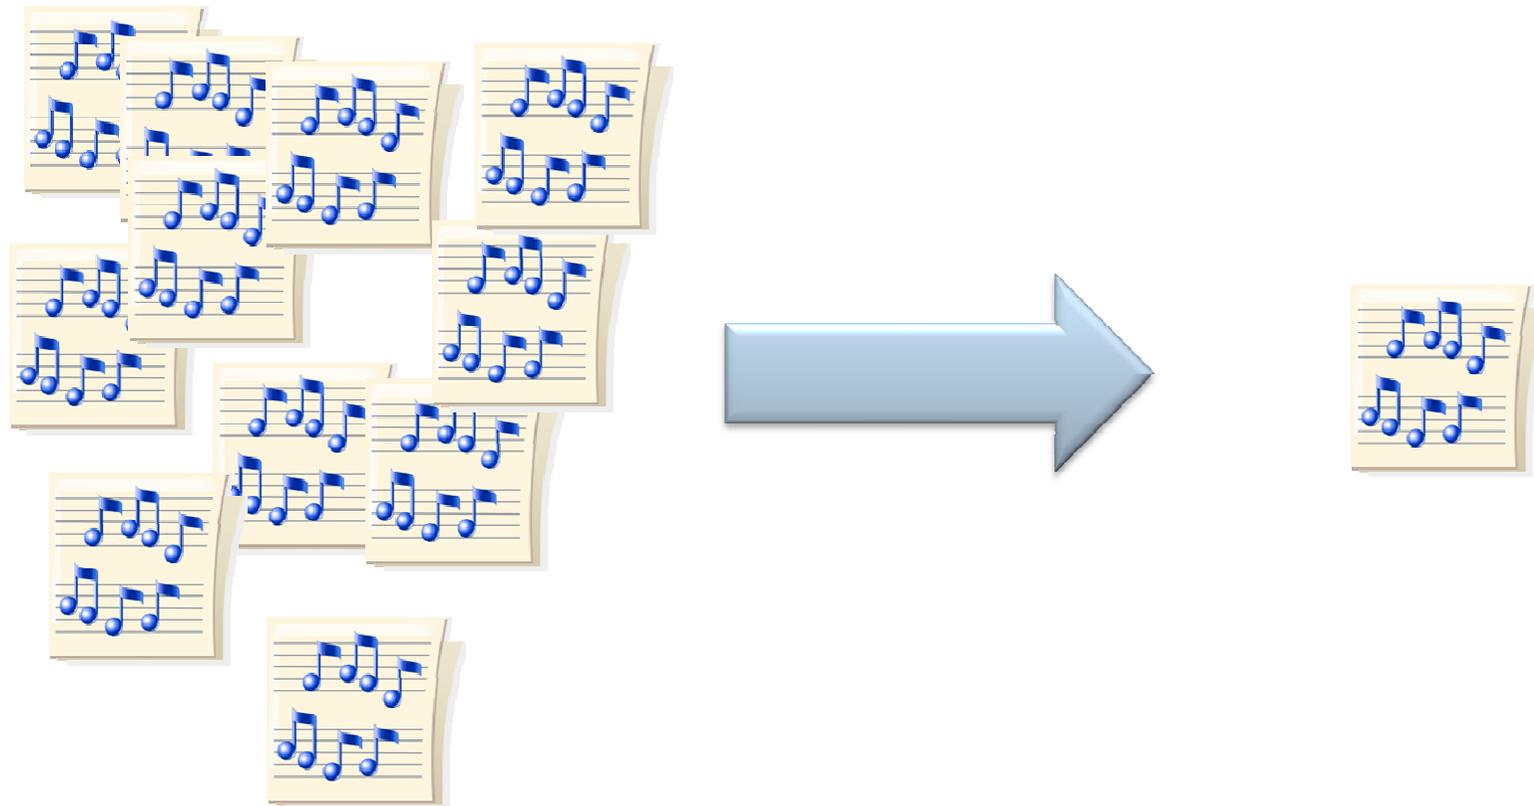

## Content-Based Methods

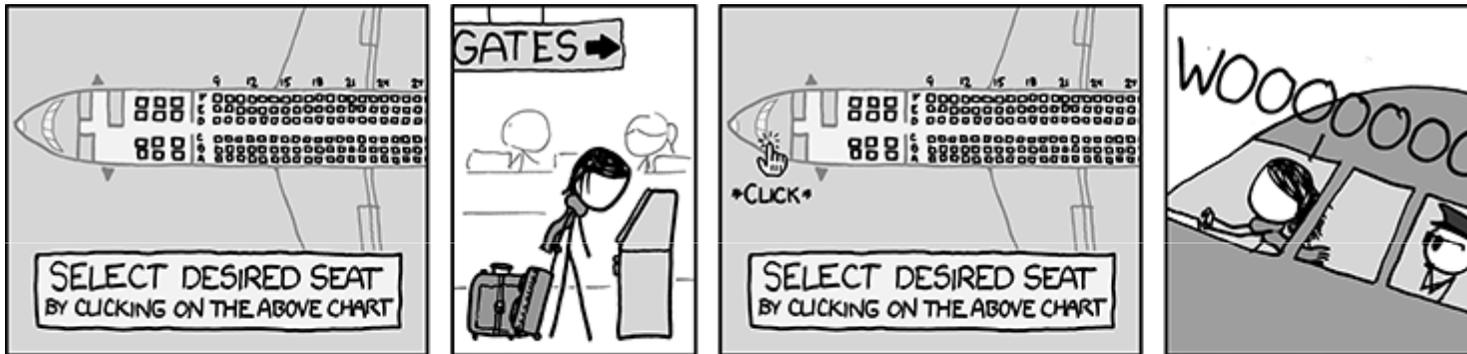

- Find other popular items by the same author or similar keywords
- Recommendation quality is relatively poor

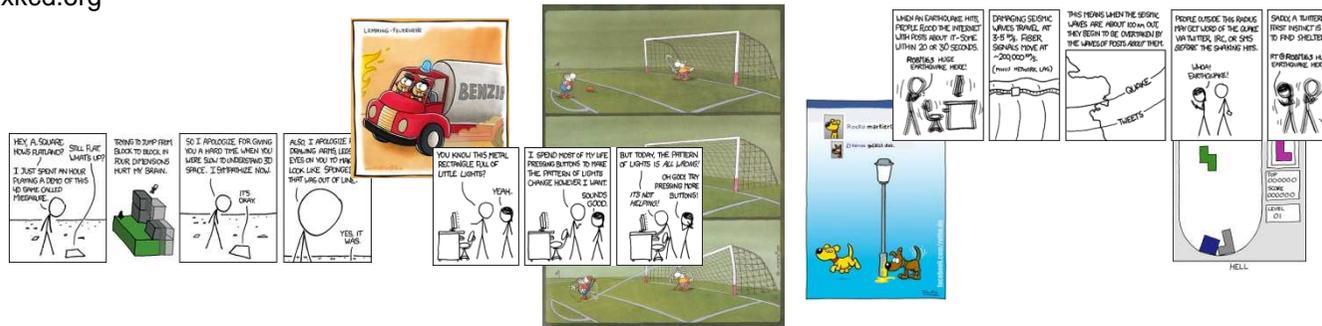

# Filtering Music

# Filtering Jokes

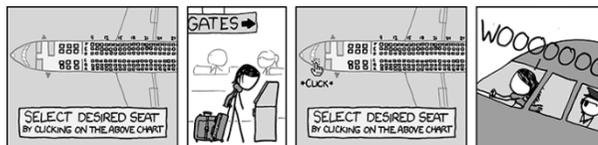

www.xkcd.org

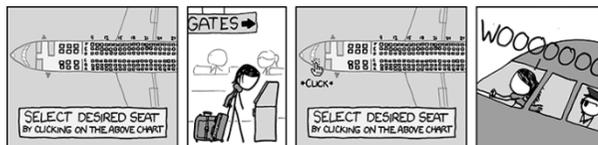

# Filtering Jokes

- Let the users rate the jokes
- Sort by average rating

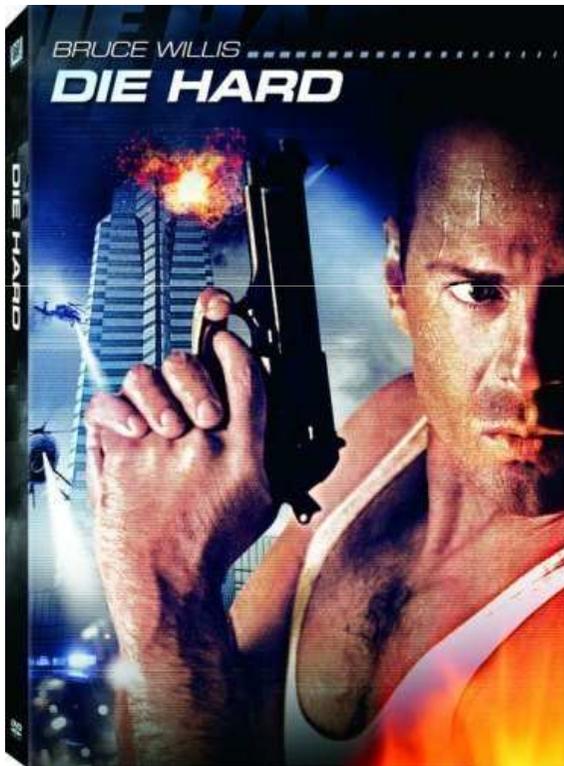

# Collaborative Filtering

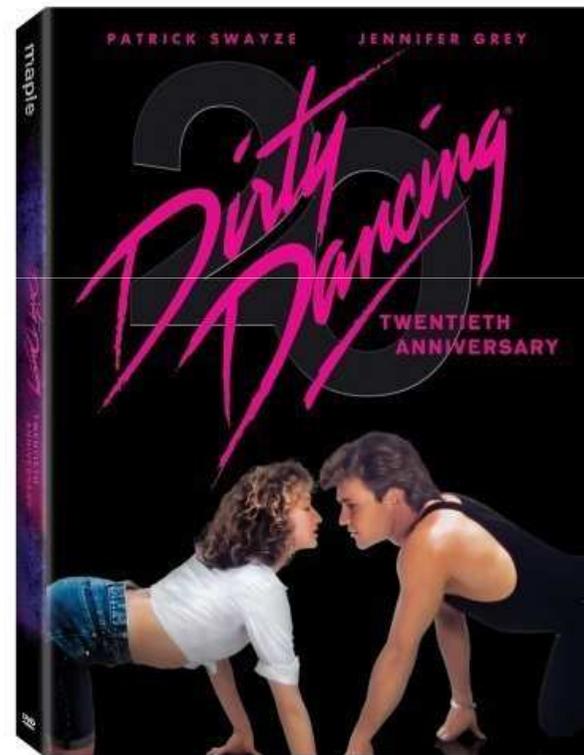

- People who have agreed in the past tend to agree in the future

# Good or Bad?

Die Hard (1988)

Dirty Dancing (1987)

# Good or Bad?

A man approached a very beautiful woman in a large supermarket and asked, "You know, I've lost my wife here in the supermarket. Can you talk to me for a couple of minutes?"

"Why?"

"Because every time I talk to a beautiful woman my wife appears out of nowhere."

# Netflix

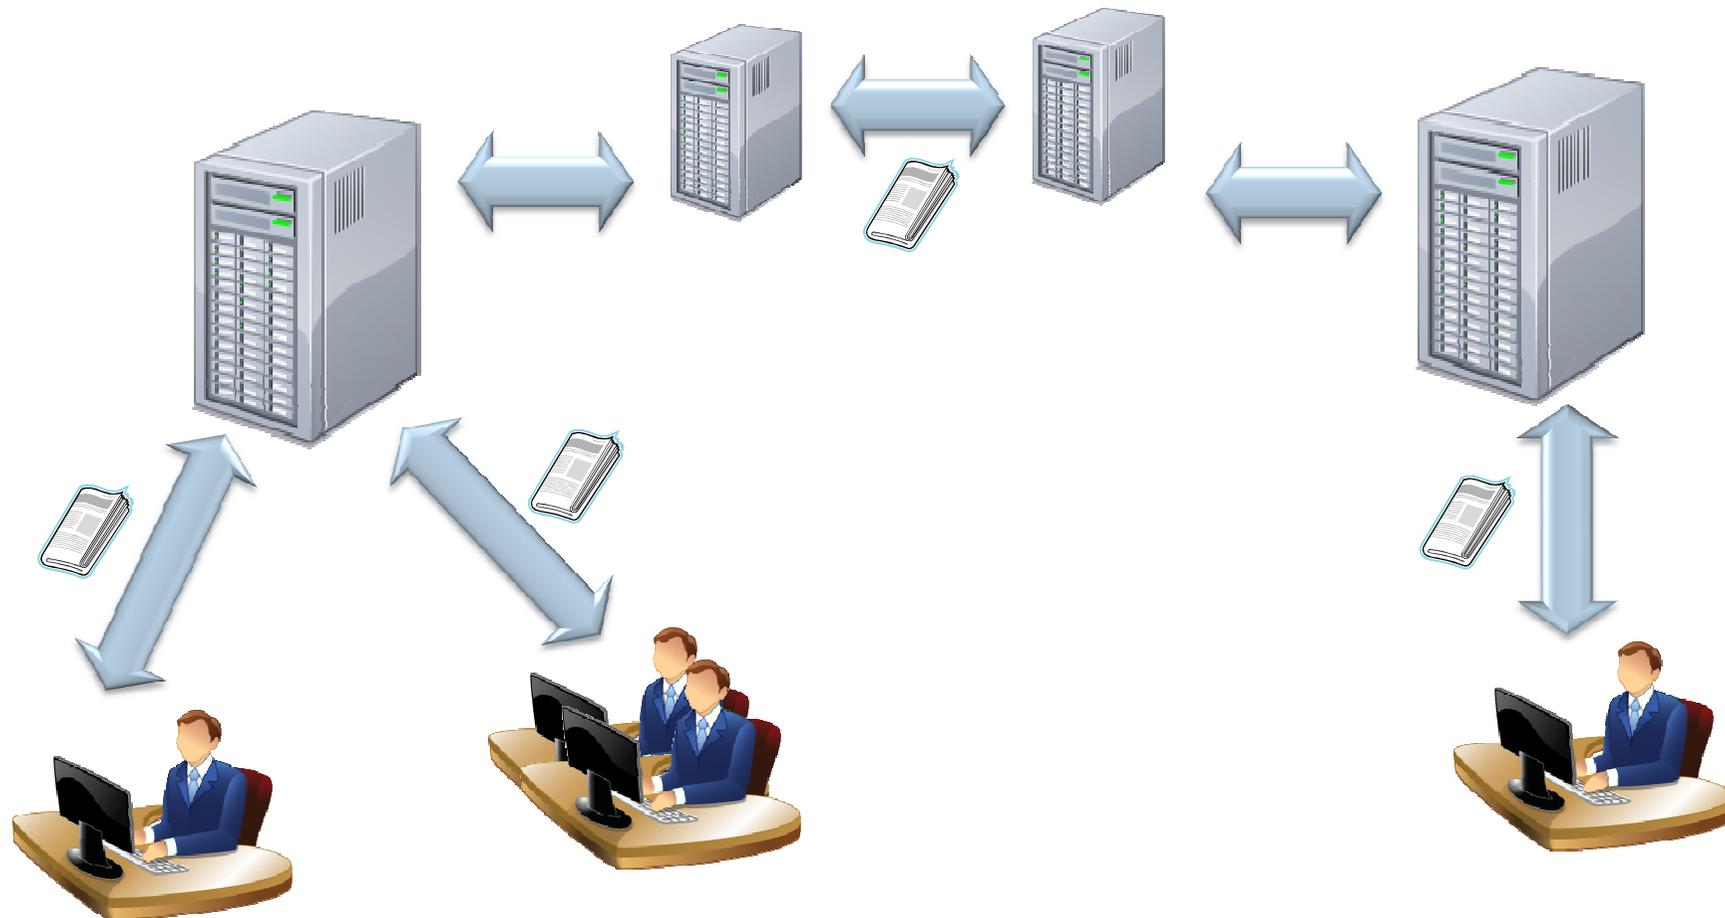

- [www.netflix.org](http://www.netflix.org)
- DVD/Blue-Ray rental and video streaming
- 1'000'000\$ for the first beating the current recommendation algorithm by 10%
  
- Competition started in October 2006
- Ended July 2009

# GroupLens: An Open Architecture for Collaborative Filtering of NetNews

Research paper from 1994 by:

- Paul Resnick, MIT Center for Coordination Science
- Neophytos Iacovou, University of Minnesota
- Mitesh Suchak, MIT Center for Coordination Science
- Peter Bergstrom , University of Minnesota
- John Riedl , University of Minnesota

# NetNews

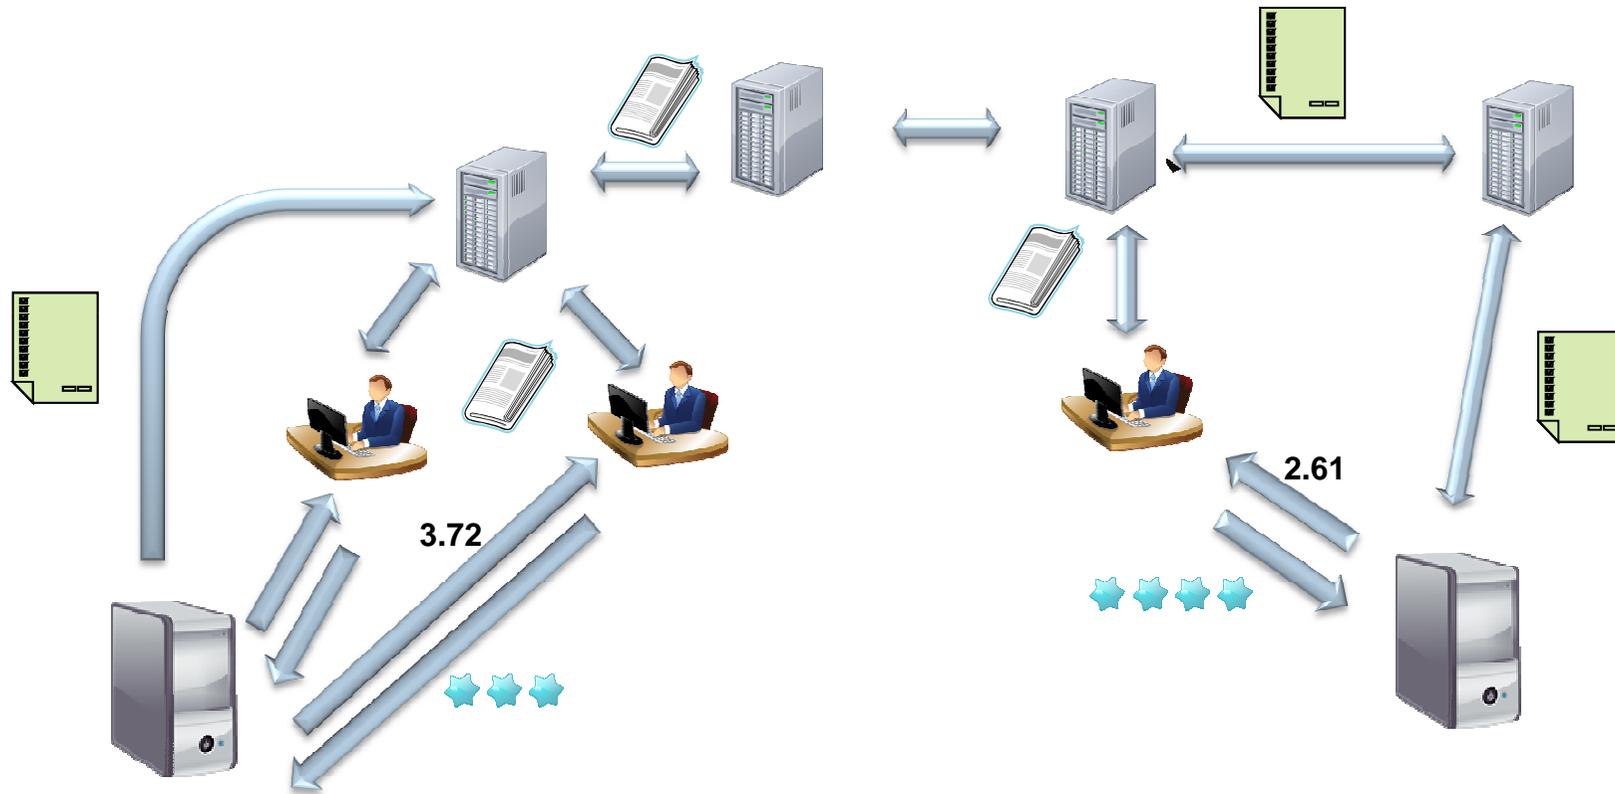

# Problems of NetNews

 Signal to noise ratio is too low

- Splitting bulletin board into newsgroups
- Moderated newsgroups
- News clients
  - Summary of the author and subject line
  - Display discussion threads together
  - String search facilities
  - Kill files

# Modification to NetNews

# Predicting Scores

- Score prediction system is robust to certain differences of interpretation of the rating scale
  - One user rates 3-5 and the other 1-3
  - One thinks 1 and the other 5 is best score

# Predicting Scores

- Predictions can be modeled as matrix filling

Item #	Ken	Lee	Meg	Nan
1	1	4	2	2
2	5	2	4	4
3			3	
4	2	5		5
5	4	1		1
6	?	2	5	

## Predicting Scores

- Assign similarities to each of the other people
- Compute over articles rated by both
- Pearson Correlation Coefficients
  - Between -1 and 1

$$r_{\text{Ken-Lee}} = \frac{\text{cov}(K, L)}{\sigma_{\text{Ken}} \cdot \sigma_{\text{Lee}}} = \frac{E[(K - \mu_{\text{Ken}})(L - \mu_{\text{Lee}})]}{\sigma_{\text{Ken}} \cdot \sigma_{\text{Lee}}}$$

$\sigma_{\text{Ken}}$  = standard deviation of Ken

$\mu_{\text{Ken}}$  = average of Ken's ratings

# Predicting Scores

- Correlation Coefficients of Ken

User	Correlation
Lee	-0.8
Meg	+1
Nan	0

#	Ken	Lee	Meg	Nan
1	1	4	2	2
2	5	2	4	4
3			3	
4	2	5		5
5	4	1		1
6	?	2	5	

## Predicting Scores

- Weighted average of all ratings on article 6
- Ken's prediction is 4.56

$$K_{6_{\text{Prediction}}} = \mu_K + \frac{\sum_{J \in \text{Raters}} (J_6 - \mu_J) \cdot r_{\text{Ken}-J}}{\sum_{J \in \text{Raters}} |r_{\text{Ken}-J}|}$$

## Scaling Issues

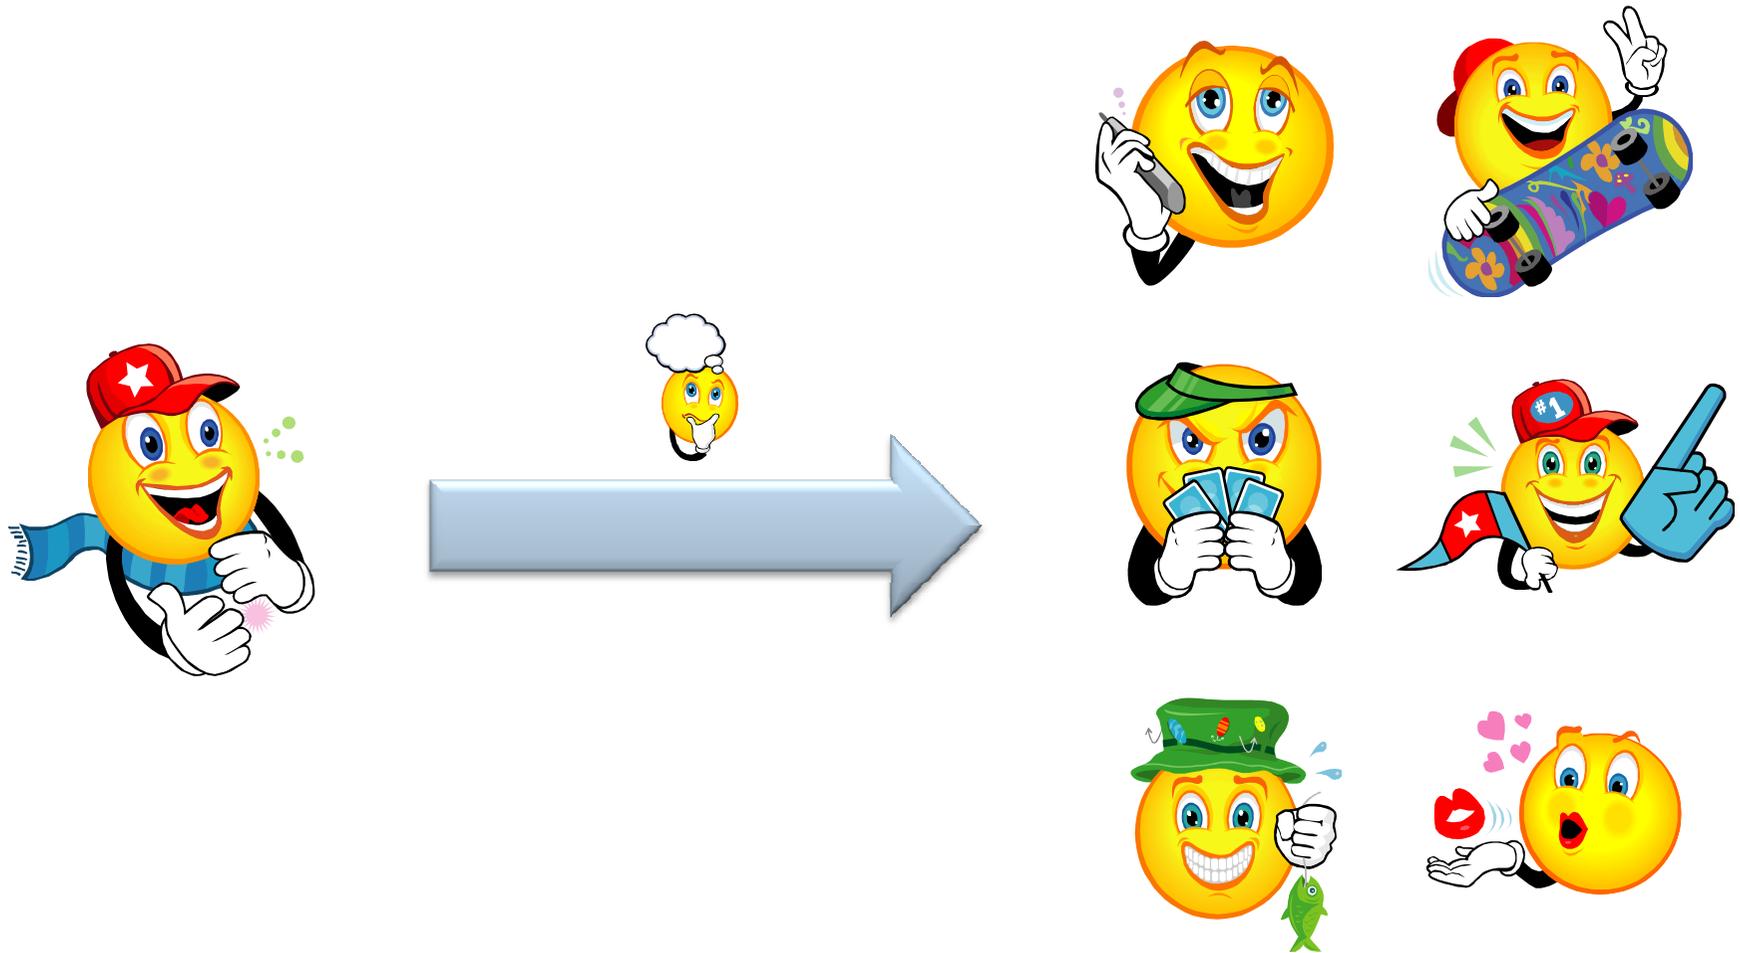

- Relevant performance measures
  - Prediction quality
  - Compute time and disk storage
- Rating is small, but each article may be rated by many users
- Volume of ratings could exceed volume of news

## Scaling Issues

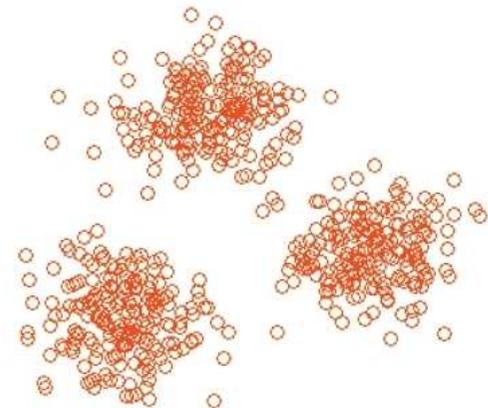

- Pre-fetching ratings and pre-computing predictions keeps user time constant
- High computation complexity
- Volume of all ratings may exceed the storage capacity
  - 100'000 users rate 10 articles per day. 100 bytes are required to store a rating. 1GB of storage required per 10 days.

# Cluster Models

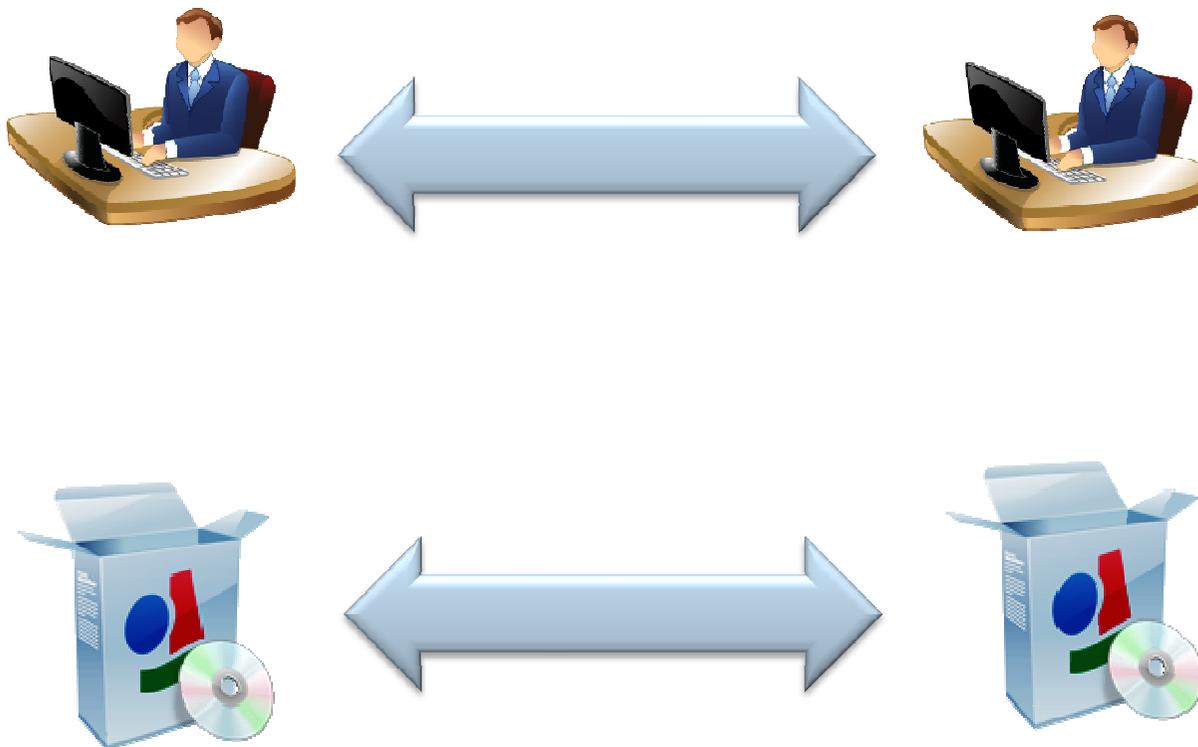

## Cluster Models

- Better online scalability and performance than classical collaborative filtering
- Complex and extensive clustering is run offline
- Prediction quality gets reduced

# Item-to-Item Collaborative Filtering

## Item-to-Item Collaborative Filtering

- Amazon.com extensively uses recommendation algorithms
- 10'000'000 products and customers
- Result returned in real-time ( $< 0.5s$ )
- Algorithm must respond immediately to new information

## Improve Your Recommendations

Items you own  
Items you've rated (3)

## How It Works - Offline

- Similar-items table
- Calculating similarity between a single product and all related products
  - Complexity:  $O(mn^2)$  - in practice:  $O(mn)$ 
    - m: number of users
    - n: number of items

## How It Works - Online

- Given a similar-items table
- Find all similar items to each of the users ratings and purchases
- Aggregate those items
- Recommend most popular and correlated items
- Number of users has no effect on performance

## General difficulties

- Cold start
- Self-fulfilling prophecy
- Recommendations for groups
- Evaluation of recommendation systems

# Conclusion

- Effective form of targeted marketing
- Mostly used in e-commerce business
  - But can always be used when signal to noise ratio is too low
