

Computational Thinking

Exercise 2

1 Egg dropping

You are in a skyscraper with n floors and you have a box of eggs. You want to find the lowest floor from which an egg thrown out of the window breaks. In particular, you want to minimize the number of throws needed to find this out in the worst case. Once an egg is broken, you cannot use it again.

Give an algorithm to find the solution ...

- ... if you only have one egg.
- ... if you have $\lceil \log n \rceil$ eggs.
- ... if you have k eggs.

2 Pizza world record

You and your friends are trying to beat the world record for the largest circular pizza. You have already cooked your pizza in a polygonal baking tray and are wondering how to trim it into a disc so as to maximize the radius of the pizza.

Figure 1: Example of the largest pizza (in red) we can extract from the polygonal cast (in yellow)

Formally, you are given a list of n 2D coordinates representing the vertices of a **convex** polygon in clockwise order. You are asked to write an algorithm returning the radius and the center of the largest circle that can be drawn inside the polygon. It is guaranteed to be unique.
