Principles of Distributed Computing
Exercise 2: Sample Solution

1 Leader Election in an “almost anonymous” Ring
a) Yes, it is possible:

Algorithm 1 Leader Election (all but one nodes have the same ID)
1: send IDs two hops around the ring
2: if the same ID has been received twice AND the received ID differs from the own ID then
3: I am the leader
4: end if

2 Distributed Computation of the AND
a) Because the size of the ring is not known to the nodes, the case where all nodes have a one as input and the case where all but one nodes have a one as input cannot be distinguished.

b) All input values have to be sent all around the ring. In order to detect the returning of the own message, we add a hop counter to each message. If the message has made $n$ hops, it has arrived where it started.

c) The following algorithm calculates the AND in a synchronous, non-uniform ring:

Algorithm 2 AND in the Ring: asynchronous, non-uniform ($n$ is the number of nodes)
1: if input bit = 0 then
2: send 0 to the neighbor in the ring
3: end if;
4: for $i := 2$ to $n$ do
5: if received a 0 and have not already sent a 0 then
6: send 0 to the neighbor in the ring
7: end if
8: end for;
9: if received at least one 0 then
10: result := 0
11: else
12: result := 1
13: end if;

If the result is 1, no message is sent, otherwise there is exactly one message over each link. Thus, time and message complexity are both $n$.
